ABSTRACT

The present article deals with the faunal diversity of the spiders belonging to the family Linyphiidae. In India, the Linyphiidae is represented by 94 species in 39 genera in 19 states and 3 union territories and 48 species are endemic. In India, *Oedothorax* Bertkau, 1883 is the largest genus consisting 17 species. Maximum 32 species of these spiders were recorded in Jammu & Kashmir followed by 18 species each in Kerala, Uttarakhand and West Bengal. In northeast part of India, 12 linyphiid species are recorded in Meghalaya while no species is reported yet from Arunachal Pradesh, Nagaland and Tripura. Interestingly, larger states in central India like Andhra Pradesh, Gujarat, Karnataka, Maharashtra, Rajasthan, and Telangana are very poorly represented by these spiders and need extensive survey for these spiders. None of the linyphiid spiders of India are recorded as endangered or vulnerable species in IUCN Red List of threatened Taxa. Therefore, conservation efforts are immediately needed for their conservation practices.

Key words: Faunal distribution, India, Sheet Weaver, Money spider, Linyphiidae

INTRODUCTION

Spiders are chelicerate arthropods belonging to the order Araneae of class Arachnida and are highly diverse and abundant terrestrial predators and their presence is frequently associated with the structural quality of the ecosystems, due to their effect of biocontrol over soil animals, particularly arthropods. Despite knowing this fact, little is known about the spider fauna in agricultural areas. The order Araneae ranks seventh in global diversity (49,006 species) after the five largest insect orders (Coleoptera – ca. 4,00,000 species, Lepidoptera – ca. 1,80,000 species, Hymenoptera – ca. 1,50,000 species, Diptera – ca. 1,25,000 species, Hemiptera – ca. 50,000 species) and one arachnid order (Acari – over 50,000 species) in terms of species diversity. Out of them, only 1,852 species belonging to 478 genera in 62 families are reported in India (Caleb & Sankaran, 2020). However, there are several species in wild and museum collections that await description and classification. It is estimated that only one third to one fifth of existing species have been described. Spiders play a very significant role in the ecology by being almost exclusively predatory and thereby regulate mostly insect populations. All spiders are venomous but venom of only few species is harmful to humans, though its venom is useful in study of neuromuscular and cardiac pharmacology (Langenegger *et al.*, 2019). Despite the applied values, the spiders have received very little attention as far as their conservation is concerned. Only few tarantulas in India are listed in IUCN Red List

(Molur *et al.*, 2008) and Siliwal *et al.* (2011) recommended immediate action to conserve them to prevent their extinction. In spite of current researches on diversity and distribution of spiders in India, their number is meager as compared to other regions of the world. Out of 49,006 described species under 4,194 genera and 128 families in the world (WSC, 2020), only 1,852 species belonging to 478 genera in 62 families are known in India (Caleb & Sankaran, 2020).

Linyphiidae is the second largest family of spiders after Salticidae encompassing 4,672 described species in 619 genera worldwide (WSC, 2020). The spiders in this family are commonly known as sheet weavers, or money spiders and are usually very small (1–10 mm long) with 8-eyes, three claws and no cribellum. The eyes are arranged in 2 rows of 4, usually heterogeneous in size with the anterior medians smaller than the rest. They are distinguishable from other families by having a point of weakness in the joint between the patella and tibia of the legs that allows the spider to break the leg from that point, if necessary. Mostly they are distributed in the temperate regions, but several species are also found in the tropics. Indeed, Linyphiidae is perhaps the most widely distributed spider family. Linyphiid spiders construct a sheet web sometimes dome shaped at ground level but they may inhabit a very wide array of habitats. Their webs do not have retreat and the spider always hang inverted below the sheet. Sometimes, the larger species put in irregular vertical snares that perform both as sheet suspension strands and as barrage balloon wires holding the flying

insects. Several species of Linyphiidae disperse by air, the phenomenon is known as ballooning or kiting particularly when their very dense populations, particularly of spiderlings, try to balloon at the same time. Ballooning occurs usually in late summer (Weyman, 1995). The density of linyphiid spiders may reach up to 29,000 individuals per cubic meter in some habitat (Duffey & Green, 1975).

In India, Pickard-Cambridge (1885) was the first to describe a linyphiid spider, *Linyphia perampla*, syn. of *Leptyphantes peramplus* and also recorded one species, *Erigone dentipalpis* (Wider, 1834), both from Jammu & Kashmir. Later on, Simon (1894) described one species, *Emenista bisinuosa* Simon, 1894 from Tamil Nadu. Thereafter, several species were described and recorded by Caporiacco (1935a) from Jammu & Kashmir and one species, *Bathyphantes leucophthalma* syn. of *Cresmatoneta leucophthalma* by Fage (1946) from Uttarakhand. Among the Indian author, Tikader (1970, 1981) was first to describe few species of linyphiid spiders from Sikkim and Himachal Pradesh and henceforth several species of these spiders were either described or recorded from many states in India. At present, a moderate amount of knowledge of Linyphiidae is available in India but the literature are all scattered and so far no consolidated account is available regarding their distribution pattern across the country. Therefore, this present work was taken up to provide up-to-date information of this family in the light of modern taxonomic concept.

MATERIALS AND METHODS

This checklist is prepared on the basis of published literature in surveys, books, journals, theses and World Spider Catalogue up to 30 October, 2020. In the present checklist, attempts have been made to correct such errors in the scientific names of the spiders. Only those synonymies were referred that were reported in India. For other synonymies, WSC (2020) may be consulted. Also, those spiders not identified up to specific level, were omitted if some species of that genus were recorded under that genus in that state. The record of linyphiid spiders is also presented species-wise as well as state and union territories wise for their easy access. Seemingly erroneous records are marked with (†). If the spider species is not endemic, its elsewhere distribution is also provided.

RESULTS AND DISCUSSION

In India, the Linyphiidae is represented by 94 species in 39 genera in 19 states and 3 union territories (Delhi, Ladakh and Jammu & Kashmir) and about half of the species (48 species) are endemic. However, this record is only 2% of the world linyphiid fauna and most of species are described or reported during the last two decades. Actually, linyphiids are most diverse in the north temperate regions than other regions. In spite of extensive surveys conducted by several arachnologists in India, these spiders were very poorly recorded in most of the states, most of the species were not recovered after their description.

The predatory behaviour of spiders is of great relevance for natural control in agroecosystems. The spiders play an important role in most terrestrial food-webs and may be very abundant in several habitats. Moreover, despite the ecological significance of spiders in terrestrial ecosystems, they have received very little

attention as far as their conservation is concerned, particularly for linyphiid spiders (Borges & Wunderlich, 2008; Borges *et al.*, 2016). Among the linyphiid spiders, only 3 species are listed as critically endangered in IUCN Red List of Threatened Animals: *Centromerus anoculus* Wunderlich, 1995 (Cardoso *et al.*, 2018a) and *C. sexoculatus* Wunderlich, 1992 (Cardoso *et al.*, 2018b) found only in Madeira (an autonomous region of Portugal) and *Nothophantes horridus* Merrett & Stevens, 1995 found in an area of less than one square kilometer in England (Cardoso & Hilton-Taylor, 2015); and 3 species are listed as vulnerable such as *Troglhyphantes gracilis* Fage, 1919 (World Conservation Monitoring Centre, 1996), *T. similis* Fage, 1919 (World Conservation Monitoring Centre, 1996b) and *T. spinipes* Fage, 1919 (World Conservation Monitoring Centre, 1996c) all found only in Slovenia. Longback, Bell *et al.* (2002) attempted to manipulate the abundance of a linyphiid spider, *Leptyphantes tenuis* (Blackwall, 1852) in field population by management of field margins.

Endemism in linyphiid spiders in India is high at the species level (48 species out of 94 species recorded), and these species are threatened with the loss and fragmentation of habitats. Though, none of the species of linyphiid spiders are listed in IUCN Red List of Threatened Animals as endangered or vulnerable in India, still like others they are also threatened due to habitat loss and fragmentation and other anthropogenic activities hampering ecosystem. Therefore, conservation efforts are immediately needed for their conservation practices. Results demonstrated that most of the surveys conducted in India have remained restricted to a few states and union territories particularly, in the Western Ghats, Eastern Ghats and north and northeast India, and most areas in the country still remain virgin. Hence, a systematic survey is essential for the entire country to find an overall representation of linyphiid spiders in the country.

In India, *Oedothorax* Bertkau, 1883 is the largest genus consisting 17 species, out of which 15 species are very recently described by Tanasevitch (2015, 2016, 2017, 2020a, b). Maximum 32 species of these spiders were recorded in Jammu & Kashmir followed by 18 species each in Kerala, Uttarakhand and West Bengal. In northeast part of India, 11 linyphiid species are recorded in Meghalaya while no species is reported yet from Arunachal Pradesh, Nagaland and Tripura. Strangely, larger states in central India like Andhra Pradesh, Gujarat, Karnataka, Maharashtra, Rajasthan, and Telangana are very poorly represented by these spiders and need extensive survey for these spiders (Figure 1). Six species, mentioned below marked with (†) seem to be misidentified and the record from India is doubtful and require re-examination. Few species of the family reported by Caporiacco (1935a) from Jammu & Kashmir remained unnoticed by Caleb & Sankaran (2020) who mentioned only 61 species under 27 genera from India. The detail list of these spiders distributed in Indian states and union territories and elsewhere are listed in Table 1.

Distribution of Linyphiidae Spiders in Different States of India

1. **Andhra Pradesh:** *Coleosoma floridanum*
2. **Assam:** *Leptyphantes* sp., *Linyphia* sp.
3. **Gujarat:** *Coleosoma floridanum*, *Erigone* sp., *Leptyphantes* sp., *Linyphia sikkimensis*, *Neriene sundaica*, *Stemonyphantes* sp.

Figure 1. Number of Species of Spiders Belonging to the Family Linyphiidae in Indian States and Union Territories.

4. Himachal Pradesh: *Caviphantes pseudosaxetorum*, *Erigone rohtangensis*, *Gongylidiellum confusum*, *Gongylidioides pectinatus*, *Indophantes digitulus*, *Oedothorax paralegrandi*, *Pelecopsis Indus*, *Scotargus pilosus*, *Tiso incisus*

5. Karnataka: *Linyphia hortensis*, *L. triangularis*, *Neriene birmanica*, *N. emphana*, *N. macella*, *N. sundaica*

6. Kerala: *Atypena adelinae*, *A. thailandica*, *Caviphantes pseudosaxetorum*, *Erigone bifurca*, *Gongylidioides keralaensis*, *Lepthyphantes lingsoka*, *L. peramplus*, *L. rudrai*, *L. stramineus*, *Linyphia sp.*, *Nasoona crucifera*, *Neriene hammeni*, *N. sundaica*, *Oedothorax cunur*, *O. kodaikanal*, *O. stylus*, *Paracymboides aduncus*, *P. tibialis*

7. Maharashtra: *Neriene sundaica*

8. Manipur: *Atypena sp.*, *Erigone bifurca*, *Labulla sp.*, *Neriene sundaica*

9. Meghalaya: *Atypena cirrifrons*, *Caviphantes pseudosaxetorum*, *Indophantes bengalensis*, *Nasoona asocialis*, *Neriene sundaica*, *Oedothorax khasi*, *O. Meghalaya*, *O. sohra*, *O. unciger*, *O. unicus*, *Ummeliata insecticeps*, *Walckenaeria saetigera*

10. Mizoram: *Atypena adelinae*

11. Odisha: *Atypena cirrifrons*, *Erigone bifurca*, *Nasoona orissa*

12. Punjab: *Neriene macella*

13. Rajasthan: *Linyphia sp.*

14. Sikkim: *Lepthyphantes bhudbari*, *L. lingsoka*, *L. rudrai*, *Linyphia sikkimensis*

15. Tamil Nadu: *Caviphantes pseudosaxetorum*, *Emenista bisinuosa*, *Indophantes pallidus*, *Linyphia sp.*, *Oedothorax cunur*, *O. kodaikanal*, *O. paracymbialis*, *O. rusticus*, *O. stylus*, *Paracymboides aduncus*, *P. tibialis*, *Paragongylidiellum caliginosum*

16. Telangana: *Callitrichia formosana*

17. Uttar Pradesh: *Erigone rohtangensis*, *Lepthyphantes peramplus*, *L. stramineus*, *Linyphia sikkimensis*, *Microbathyphantes palmarius*, *Oedothorax globiceps*

18. Uttarakhand: *Agyneta sp.*, *Anguliphantes nepalensis*, *Atypena adelinae*, *Bathyphantes sp.*, *Caviphantes pseudosaxetorum*, *Cresmatoneta leucophthalma*, *Gongylidiellum confusum*, *Gongylidioides pectinatus*, *Lepthyphantes rudrai*, *Linyphia sikkimensis*, *Microlinyphia sp.*, *Neriene birmanica*, *N. macella*, *N. sundaica*, *Pelecopsis Indus*, *Pityohyphantes sp.*, *Scotargus pilosus*, *Tiso incises*

19. West Bengal: *Anguliphantes nepalensis*, *A. nepalenoides*, *Callitrichia formosana*, *Gongylidiellum nepalense*, *Indophantes bengalensis*, *I. tonglu*, *Lepthyphantes bhudbari*, *L. lingsoka*, *L. rudrai*, *Nasoona indiana*, *Oedothorax cornutus*, *O. falciferoides*, *O. lopchu*, *O. villosus*, *Oia sororia*, *Tapinocyboides bengalensis*, *Tiso indianus*, *Walckenaeria martensi*

Distribution of Linyphiidae Spiders in Different Union Territories of India

1. Delhi: *Microbathyphantes palmarius*

2. Jammu & Kashmir: *Araeoncus duriusculus*, *Atypena sp.*, *Collinsia crassipalpis*, *Erigone dentipalpis*, *E. pseudovagans*, *E. rohtangensis*, *Gongylidiellum confusum*, *G. nigrolimbatum*, *Gongylidium baltoi*, *Heterolinypbia tarakotensis*, *Indophantes digitulus*, *Lepthyphantes allegrii*, *L. annulipes*, *L. bhudbari*, *L. deosaicola*, *L. incertissimus*, *L. leprosus*, *L. nigridorsus*, *L. peramplus*, *L. stramineus*, *L. trivittatus*, *Linyphia albipunctata*, *L. consanguinea*, *L. triangularis*, *Microlinyphia pusilla*, *Minicia vittata*, *Neriene birmanica*, *Oedothorax caporiaccoi*, *O. globiceps*, *Piniphantes himalayensis*, *Tiso megalops*, *Troxochrota kashmirica*

3. Ladakh: *Erigone jammu*, *Linyphia sp.*
